

SpecTec delivers Planned Maintenance and Information System for the HiLoad Units

Remora ASA has selected the world leader, SpecTec, to deliver a class approved Planned Maintenance and Information System for daily management of the HiLoad units. The AMOS (Asset Management Operating System) software allows operation and control of all technical and documentation aspects related to maintenance, spare part and stock control, purchasing and procurement as well as quality and safety documentation management.

As of today, more than 12,000 AMOS licenses have been sold to more than 1,200 companies in the maritime industry, with more than 7,000 ships managed on a daily basis.

The process of developing a database began in February, and a complete system is planned for delivery in June this year. Remora's technical superintendent, Fred Arne Høifødt, is working closely with SpecTec in order to develop a tailor made structure. "I am pleased with the selection of the supplier and confident that SpecTec's AMOS software will contribute to an efficient management of Remora's future HiLoad fleet," says Høifødt
